Miracles of Aloe Vera

During the past three years there has been considerably revived interest in Aloe Vera as a cosmetic ingredient. Several major cosmetics and consumer products companies have incorporated it into their products and others are at the development or pilot stage of their own line of Aloe Vera Cosmetics.

all take advantage of the age-old reputation of Aloe Vera as a skin softener and moisturiser. It is commonly believed that the moisturising emollient and healing properties of Aloe Gel are due to the polysaccharide present.

The major polysaharides present have been determined to be glucomannan. Other polysaccharides containing galatose and uronic acids as well as pentose are also present. It is possible that the gel's beneficial properties are not due to the polysaccharides alone, but rather from a synergistic effect of these compounds with other substances present in the gel.

If that sounds a little complex, it is no wonder. After three decades of intensive analysis, the laboratories are only partially able to explain Aloe Vera's incredible non toxic potency.

the gel is a most ingenious mixture of antibiotics, astringent, coagulating agents, whole also, being a pain and scar inhibitor and growth simulator. One famous German research pharmacist, Freytag calls it a wound "hormone". In simple terms, it accelerates the healing of injured surfaces.

Aloe Vera is widely recognised for being harmless and not having any negative side effects. Fortunately, many people who have allergies have a host of allergic reactions from other things. It is found that the application of Aloe Vera reduces or eliminates the effect of the other reactions.
